

Other Medications That Support **FEMALE** FERTILITY TREATMENTS

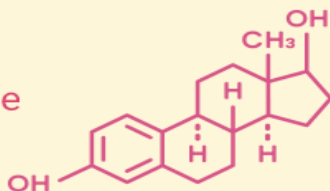

Gonadotropin releasing hormone agonists

GnRH agonists, such as leuprolide acetate, are used in IVF for triggering ovulation.

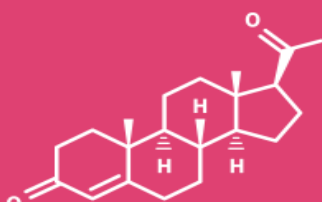

Estrogen

Vaginal estrogen may help minimize the anti-estrogenic side effects of clomiphene citrate.

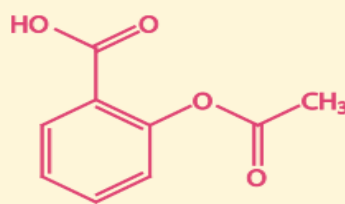

Progesterone

It is used to support the luteal phase after implantation during an IVF cycle.

Aspirin and heparin

Low-dose aspirin and low molecular weight heparin (LMWH) may be prescribed to women experiencing recurrent miscarriages.

Medication for thyroid problems

Oral hypothyroidism treatment has been found beneficial in otherwise asymptomatic infertile women.
