About

Beavers

To Share With Children

The babies of beavers are called kits.

They are nocturnal, semiaquatic rodents that work extremely hard.

They use their tails to notify each other about approaching predators.

They can hold their breath for about 15 minutes when going underwater.

Beavers make dams that may change the course of a river.

North America has the world's largest beaver dam, with a depth of 850 meters.

Beavers are adaptable to weather changes, including surviving ice-cold winters.
