

Types Of Emergency Lighting System

Solar

Designed with a small solar panel, these lights charge with sunlight. They do not need electric input to illuminate.

Rechargeable

These lights must be charged by plugging in the electric outlet. You can operate this light as needed and recharge the battery.

Battery-operate

Similar to a torch, these work only when the emergency light is loaded with batteries.

Power failure

The lights illuminate automatically during the power outage and recharge when the power returns.

Wet location

Also known as explosion-proof lights, they are used in places with flammable objects.

Fire signage

Usually found in most commercial buildings or shopping malls, they get illuminated automatically to show the path.
