

## ANECDOTAL INFORMATION ABOUT **SUGAR BUG VEIN** IN INFANTS

The sugar bug veins, though present, may not always be visible.

It is morphologically a prominent dorsal nasal vein.

Certain factors, including dietary and genetic factors, may impact the appearance of these veins.

An anecdotal belief is that sugar bug vein babies have sensitive digestion.

These veins may usually become prominent when the baby laughs or cries.

In most babies, these veins may disappear around the one-year mark.
