

# Spot The Signs Of An

# Unalarming Fever

Your child's fever may not be severe if

They have a reasonably good appetite

They seem alert as usual without any unusual fussiness or drowsiness

Their skin color is normal and not pale

They are equally interested in playing their favorite sport or activity

## A few words of advice

A low-grade fever may help boost children's immunity and fight infections. Hence it may be better to let a mild fever run its course and not eliminate it with medicines

Try not to cover them with too many clothes and layers to help them with chills. Prefer to use lightweight blankets and clothes to keep them comfortable without further raising the temperature
